## Quad Driver for GaAs FET or PIN Diode Switches and Attenuators

Rev. V1

#### Features

- High Voltage CMOS Technology
- Four Channel
- Positive Voltage Control
- CMOS device using TTL input levels
- Low Power Dissipation
- Low Cost 4x4 mm, 20-lead PQFN Package
- 100% Matte Tin Plating over Copper
- Halogen-Free "Green" Mold Compound
- 260°C Reflow Compatible

**Ordering Information** 

#### Description

The MADR-009443-000100 is a four channel driver used to translate TTL control inputs into gate control voltages for GaAs FET microwave switches and attenuators. High speed analog CMOS technology is utilized to achieve low power dissipation at moderate to high speeds, encompassing most microwave switching applications. The output HIGH level is optionally 0 to +2.0V (relative to GND) to optimize the intermodulation products of FET control devices at low frequencies. For driving PIN Diode circuits, the outputs are nominally switched between +5V & -5V. The actual driver output voltages will be lower when driving large currents due to the resistance of the output devices.

Part Number	Package
MADR-009443-000100	Bulk Packaging
MADR-009443-0001TR	1000 piece reel
MADR-009190-000DIE	Die <sup>1</sup>

Note: Reference Application Note M513 for reel size information.

Commitment to produce in volume is not guaranteed.

- 1. See the MADR-009190-000100 data sheet for the die outline
- 2. The exposed pad centered on the package bottom may be isolated or connected to ground.

### **Functional Schematic**

### Pin Configuration<sup>2</sup>

Pin No.	Function	Pin No.	Function
1	Ground	11	Output A4
2	NC	12	Output B4
3	NC	13	Vee
4	Output A1	14	NC
5	Output B1	15	Vcc
6	Output A2	16	C4
7	Output B2	17	C3
8	NC	18	C2
9	Output A3	19	C1
10	Output B3	20	Vopt

\* Restrictions on Hazardous Substances, European Union Directive 2002/95/EC.

ADVANCED: Data Sheets contain information regarding a product M/A-COM Technology Solutions is considering for development. Performance is based on target specifications, simulated results, and/or prototype measurements. Commitment to develop is not guaranteed. **PRELIMINARY:** Data Sheets contain information regarding a product M/A-COM Technology Solutions has under development. Performance is based on engineering tests. Specifications are typical. Mechanical outline has been fixed. Engineering samples and/or test data may be available.

### Quad Driver for GaAs FET or PIN Diode Switches and Attenuators

Rev. V1

### Guaranteed Operating Ranges (for driving FET or PIN devices) <sup>3,4,7</sup>

Symbol	Parameter	Unit	Min.	Тур.	Max.
V <sub>CC</sub>	Positive DC Supply Voltage	V	4.5	5.0	5.5
V <sub>EE</sub>	Negative DC Supply Voltage	V	-10.5	-5.0	-4.5
V <sub>OPT</sub> <sup>5</sup>	Optional DC Output Supply Voltage	V	0	_	V <sub>cc</sub>
V <sub>OPT</sub> - V <sub>EE</sub>	Negative Supply Voltage Range	V	4.5	Note 6	16.0
V <sub>CC</sub> - V <sub>EE</sub>	Positive to negative Supply Range	V	9.0	10.0	16.0
T <sub>OPER</sub>	Operating Temperature	°C	-40	+25	+85
I <sub>OH</sub>	DC Output Current - High	mA	-35	_	—
I <sub>OL</sub>	DC Output Current - Low	mA	_	_	35
$T_{rise},T_{fall}$	Maximum Input Rise or Fall Time	ns	_	_	500

3. Unused logic inputs must be tied to either GND or  $V_{\text{CC}}$ .

4. All voltages are relative to GND.

5. V<sub>OPT</sub> is grounded in most cases when FETs are driven. To improve the intermodulation performance and the 1 dB compression point of GaAs control devices at low frequencies, V<sub>OPT</sub> can be increased to between 1.0 and 2.0V. The nonlinear characteristics of the GaAs control devices will approximate performance at 500 MHz. It should be noted that the control current that is on the GaAs MMICs will increase when positive controls are applied.

6. When this driver is used to drive PIN diodes, V<sub>OPT</sub> is often set to +5.0V, with V<sub>EE</sub> set to -5.0V.

7. 0.01 uF decoupling capacitors are required on the power supply lines.

#### Handling Procedures

Commitment to produce in volume is not guaranteed.

Please observe the following precautions to avoid damage:

#### **Static Sensitivity**

Silicon Integrated Circuits are sensitive to electrostatic discharge (ESD) and can be damaged by static electricity. Proper ESD control techniques should be used when handling these devices.

#### **Truth Table**

Input	Outputs

13. Total Power Dissipation is calculated by the following formula:  $PD = V_{CC}^2 fC_{PDC} + V_{EE}^2 fC_{PDE} + V_{OPT}^2 fC_{PDO}$ 

### Switching Waveforms—Driving PINs<sup>14</sup>

## Switching Waveforms—Driving 35 mA load with 25 pF load capacitance

14. This effect is only apparent when driving high currents and only occurs on the rising edges. On the schematic in "Typical Application for a SPDT Switch" note that the rising edge turns on the shunt diodes. There will be a slight effect on isolation over time, but the insertion loss should not be affected.

### Quad Driver for GaAs FET or PIN Diode Switches and Attenuators

#### **Description of Circuit**

The MADR-009443-000100 provides four pairs of complementary outputs that are each capable of driving a maximum of ± 35 mA into a load. In addition, with proper capacitor selection (C3 & C4) used in parallel with the current setting resistor (R1 & R2), additional spiking current can be achieved.

To achieve the Non-Inverting and Inverting complementary voltages, each output is switched between two internal FETs. The FETs are connected to V<sub>OPT</sub> for the positive output and V<sub>EE</sub> for the negative output. V<sub>OPT</sub> and V<sub>EE</sub> are adjustable for various configurations and have the following limitations: V<sub>EE</sub> can be no more negative than -10.5 volts; V<sub>OPT</sub> can be no more positive than +7.0 volts AND V<sub>OPT</sub> must always be less than or equal to V<sub>CC</sub>. Increasing V<sub>OPT</sub> beyond V<sub>CC</sub> will prevent the device from switching states when commanded to by the logic input. The most common configuration is to drive V<sub>EE</sub> at -5.0 volts with V<sub>CC</sub> and V<sub>OPT</sub> tied together at +5.0 volts.
